3D Geometry Basics

- How do we represent an object in 3D?
- What is an object?
- Problem: all vertices change coordinates during movement
- Solution: describe points on object relative to an object frame
  $_{global}P_1 = (0.1, 0.1, 0.0)$
 $_{box}P_1 = (0.0, 0.0, 0.0)$

3D Geometry Basics

- How do we represent an object in 3D?
- What is an object?
- Problem: all vertices change coordinates during movement
- Solution: describe points on object relative to an object frame
 $_{global}P_1 = (0.1, 0.1, 0.0)$
  $_{box}P_1 = (0.0, 0.0, 0.0)$
- What do we need to describe the object frame?

4

3D Geometry Basics

- *box* has a position and orientation relative to *global*

- *position* & *orientation* together are called *pose*

- $_{global}T_{box}$ is a transformation that transforms poses from *box* to *global*

- How do we represent position and orientation?

Rotation Representations

There are 4 common ways to describe rotations:

- euler angles
- rotation matrix
- axis-angle
- quaternion

Euler Angles

- Describes orientation using 3 angles:
  roll (x-rotation), pitch (y-rotation), yaw (z-rotation)

- Rotations are applied in sequence.
  What is the sequence is defined through a convention.
  There are many conventions, most common are z-y-x, x-y-z and z-x-z

Universität Bremen | EASE | Artificial Intelligence

Robot Programming with ROS Arthur Niedźwiecki,
2. Coordinates & Transforms Stefan Eirich
26th Oct. 2023

Faculty 03
Mathematics &
Computer Science

Euler Angles

+ easy to interpret
– has a Gimbal lock problem
– not suited for interpolation
– there are many possible conventions, always make sure you know which one is used!
→ only useful for user interaction

Universität
Bremen

Computer Science

Euler Angles

Loss of one degree of freedom, e.g. after 90° pitch (in this case red axis).

Axis-Angle

- any rotation can be represented as right hand rotation by θ degree about a unit vector *e*
- angle can be encoded in length of the vector

$$\begin{pmatrix} e_x \\ e_y \\ e_z \end{pmatrix}, \theta \rightarrow \begin{pmatrix} \theta e_x \\ \theta e_y \\ \theta e_z \end{pmatrix}$$

- can be rotated by rotation matrices using matrix multiplication

Universität Bremen

CEASE

Artificial Intelligence

Robot Programming with ROS Arthur Niedźwiecki,
2. Coordinates & Transforms Stefan Eirich
26th Oct. 2023

Faculty 03
Mathematics &
Computer Science

Axis-Angle

- – math can get unstable when θ is close to 0 or π, because there are infinitively many possible axis
- – represents rotation by θ differently from $\theta + 2\pi$, but it is the same rotation
- + easy interpolation, just scale the angle, but take into account that $\theta = \theta + 2\pi$
- → more useful when describing rotation differences/changes instead of orientations, found in ROS messages like Twist or Accel.

Universität Bremen · CASE · Artificial Intelligence

Robot Programming with ROS Arthur Niedźwiecki,
2. Coordinates & Transforms Stefan Eirich
26th Oct. 2023

Faculty 03
Mathematics &
Computer Science

Quaternion

- $q = (x, y, z, w)$
- number system introduced by Hamilton as an extension of complex numbers, only use case is representation of rotations
- only unit quaternions are used to represent rotations
- can be interpreted as an improved version of axis-angle

- $$\begin{pmatrix} a_x \\ a_y \\ a_z \end{pmatrix}, \alpha \rightarrow \begin{pmatrix} a_x \cdot \sin(\alpha/2) \\ a_y \cdot \sin(\alpha/2) \\ a_z \cdot \sin(\alpha/2) \\ \cos(\alpha/2) \end{pmatrix}$$

Rotation Matrix

- 3 x 3 matrix R
- is an orthogonal matrix, i.e. $det(R) = 1$ and $R^{-1} = R^T$
- this means, all raw (and correspondingly column) vectors are unit vectors, orthogonal to each other
- example: $R = \begin{pmatrix} cos(\theta) & -sin(\theta) & 0 \\ sin(\theta) & cos(\theta) & 0 \\ 0 & 0 & 1 \end{pmatrix}$ rotates about z-axis by θ

Universität Bremen

Artificial Intelligence

Robot Programming with ROS Arthur Niedźwiecki,
2. Coordinates & Transforms Stefan Eirich
26th Oct. 2023

**Faculty 03**
Mathematics &
Computer Science

Rotation Matrix

- example:
$$R = \begin{pmatrix} cos(\theta) & -sin(\theta) & 0 \\ sin(\theta) & cos(\theta) & 0 \\ 0 & 0 & 1 \end{pmatrix}$$
  rotates about z-axis by θ

- $_{global}R_{box} = \begin{pmatrix} 0.88 & -0.48 & 0 \\ 0.48 & 0.88 & 0 \\ 0 & 0 & 1 \end{pmatrix}$

- columns are axis of box in the global coordinate frame

$_{global}Z_{box} = \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}$

$_{global}X_{box} = \begin{pmatrix} 0.88 \\ 0.48 \\ 0 \end{pmatrix}$

box

global

$_{global}Y_{box} = \begin{pmatrix} -0.48 \\ 0.88 \\ 0 \end{pmatrix}$

Rotation Matrix

+ easiest to do math with
  - rotate a vector with rotation matrix using matrix multiplication
  - rotation matrices can be combined using matrix multiplication
+ easy to construct rotation matrix from 3 vectors
+ can be extended to include translation in 4x4 matrix
– uses 9 numbers to describe 3 degrees of freedom
– matrix operations result in buildup of rounding error, you might have to normalize often
– not suitable for interpolation

Quaternion

+ in contrast to axis-angle, stable when angle is close to zero and π

+ removes the $\theta = \theta + 2\pi$ problem from axis-angle

+ more compact representation than rotation matrices

+ best for interpolation (slerp algorithm)

− difficult to interpret

$\rightarrow$ most useful for interpolation and describing orientations
ROS standard for representing poses

Universität Bremen | EASE | Artificial Intelligence

Robot Programming with ROS Arthur Niedźwiecki, **Faculty 03**
2. Coordinates & Transforms Stefan Eirich Mathematics &
26th Oct. 2023 Computer Science

Rotations representations

- use euler angles only on an interface level
- use axis-angle or quaternion for rigid body dynamics
- use quaternions when storing/sending orientation information or for interpolation
- else use rotation matrices for easy mathematical operations

Universität Bremen

Computer Science

Homogeneous Transformations

- 4 x 4 matrix to represent pose transformations
- $_aT_b$ means transform from frame b to a, i.e.:
  $_aT_b \cdot {}_bP = {}_aP$
- $_aT_b$ is the same as $_aP_b$, i.e. pose of origin of b in a
- combined transformation:
  $_cT_b \cdot {}_bT_a = {}_cT_a$
- invertible: $_bT_a^{-1} = {}_aT_b$
- but $_bT_a^{-1} \neq {}_bT_a^T$

Rotation Matrix

$$\begin{pmatrix} r_{0,0} & r_{0,1} & r_{0,2} & x \\ r_{1,0} & r_{1,1} & r_{1,2} & y \\ r_{2,0} & r_{1,2} & r_{2,2} & z \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

Homogeneous Transformation

- How do we do $_cT_b \cdot {_bP} = {_cP}$?
- Append 1 to point P, before matrix multiplication:

$$\begin{pmatrix} r_{0,0} & r_{0,1} & r_{0,2} & x \\ r_{1,0} & r_{1,1} & r_{1,2} & y \\ r_{2,0} & r_{2,1} & r_{2,2} & z \\ 0 & 0 & 0 & 1 \end{pmatrix} \cdot \begin{pmatrix} p_x \\ p_y \\ p_z \\ 1 \end{pmatrix} = \begin{pmatrix} r_{0,0}p_x + r_{0,1}p_y + r_{0,2}p_z + x \cdot 1 \\ r_{1,0}p_x + r_{1,1}p_y + r_{1,2}p_z + y \cdot 1 \\ r_{2,0}p_x + r_{2,1}p_y + r_{2,2}p_z + z \cdot 1 \\ 0p_x + 0p_y + 0p_z + 1 \cdot 1 \end{pmatrix}$$
Homogeneous Transformation

- to transform $_{box}P_2$ into the global frame $_{global}P_2$, multiply with $_{global}T_{box}$
- $_{global}P_2 = {_{global}}T_{box} \cdot {_{box}}P_2$

Homogeneous Transformation

- what is the pose of P_A in global coordinate frame: $_{global}P_A$?
- choose frame where it is the easiest to express a pose
- $_{box}P_A = (0.05, 0.15, 0.05, 1.0)$
- $_{global}P_A =_{global} T_{box} \cdot_{box} P_A$

Robot Programming with ROS
2. Coordinates & Transforms

Arthur Niedźwiecki,
Stefan Eirich
26th Oct. 2023

Faculty 03
Mathematics &
Computer Science

Motivation

- Robots consist of many *parts* aka *links*

- Each link has its own *coordinate frame*

- Links change their position over time (including the robot base)

- Sensors measurements are defined in their own frame

- Example: transformations from camera to hand coordinates are needed for grasping objects

Motivation

Tracking Coordinate Frame Changes

- Transforms are produced by different nodes:
  - Localization node (AMCL, gmapping) for finding robot's pose in map
  - Odometry node (base driver) for tracking movement since initial pose
  - Joint positions (robot controllers and robot_state_publisher)
- Many publishers, many consumers
- Distributed system, redundancy issues, ...

↓

- **TF**: a coordinate frame tracking system

What is tf?

transform Library – a distributed coordinate frame tracking system

- Standardized protocol for publishing transforms to tf listeners
- Looking up and calculating transforms by asking tf listeners
- tf listener can be either local Lisp program or global tf buffer
- default global tf buffer is TF2's buffer_server
- ROS API for looking up, calculating and sending transforms
- Transforms are published on /tf and /tf_static topics:
  /tf
    - for all transforms that change over time
   - publish with a fixed rate, even if transform didn't change
  /tf_static
    - assumed to be static, thus never outdated
    - useful for reducing redundancy
    - only publish once with latched flag

TurtleSim TF

Launch the turtlesim TF demo:

```
$ roslaunch turtle_tf turtle_tf_demo.launch
```
Utilities

- `view_frames`
- `tf_echo`
- `tf_monitor`
- `static_transform_publisher`
- RViz

Utilities

Generate a TF tree graph:

```
$ rosrun tf view_frames
```

- TF tree consists of frames (links) and the transforms between them.
- Each transform is cached (10 secs default caching time)
- Transforms must form a proper tree (no cycles)
- Can have disconnected trees, but you can only ask for transforms inside of the same tree

Utilities

```
$ rosrun tf tf_echo <source_frame> <target_frame>
```

tf_echo

```
1  $ rosrun tf tf_echo turtle1 turtle2
2  At time 0.000
3  - Translation: [0.100, 0.100, 0.000]
4  - Rotation: in Quaternion [0.000, 0.000, 0.247, 0.969]
5            in RPY (radian) [0.000, -0.000, 0.500]
6            in RPY (degree) [0.000, -0.000, 28.648]
```

Utilities

- rosrun tf2_ros static_transform_publisher x y z
  yaw pitch roll frame_id child_frame_id
  or
  rosrun tf2_ros static_transform_publisher x y z
  qx qy qz qw frame_id child_frame_id
- publishes $_{global}T_{box}$

static_transform_publisher

```
$ rosrun tf2_ros static_transform_publisher 0.1 0.1 0 3.14 0 0 global box
```

TF and time

- tf buffers transforms for X seconds
- possible to lookup transforms from the past
- tf interpolates frames
- tf does not extrapolate! it can't see into the future

Python TF

tf

```
1   import rospy
2   import tf
3   rospy.init_node('turtle_tf_listener')
4   listener = tf.TransformListener()
5   rospy.wait_for_service('spawn')
6   rate = rospy.Rate(10.0)
7   while not rospy.is_shutdown():
8       try:
9           (trans,rot) = listener.lookupTransform('/turtle2', '/turtle1', rospy.Time(0))
10          print(trans, rot)
11      except (tf.LookupException, tf.ConnectivityException, tf.ExtrapolationException):
12          print("No frame found")
13          pass
14      rate.sleep()
```
